

We did show display in HEO vs. Order visibility in Cerner. We are struggling with clinicians seeing orders

Visibility of orders:

- Prior state-all active orders displayed in clear ADC VAANDISML format which broke out orders in categories.
- Providers, nurses and clinical care specialty groups used this view
- Order review and order entry occurred in the same window allowing for the clinician to see what currently active vs pulling up a different window to review

Clinical decision support through order entry (will pull iform example during the discussion)

- Ability to add in decision support prompts at the time of order entry vs at the end
